

## **PRESS INFORMATION**

---

### **Demolition of foundations - demolition of pipeline foundations in rough country**

#### **DEMOLITION OF SOLID CONCRETE FOUNDATIONS OF A ABANDONED PIPELINE IN A REMOTE AREA IN JAPAN.**

**Dense, impassable vegetation prohibited the use of excavators and large demolition machines or equipment requiring transporters or generators.**

Darda rock and concrete splitters, by contrast, were sufficiently compact to enable them to be transported to the site without any problem. The splitting cylinders were powered by a diesel-engine unit, enabling them to be used independently. The foundations were initially split horizontally, then vertically, producing small easily transportable sections. In a difficult situation like this, the Darda method has proved to be an economical, time-saving option.
